## **Mobility Report - Ioannis Stathopoulos**

### **European Congress of Radiology (ECR) 2023**

**Vienna, 1-5/03/2023**

The main objective of the mobility was the participation and attendance of the ECR 2023. ECR 2023 is the biggest radiology conference in Europe and an ideal opportunity for young medical physicists to interact with different experts and professionals

During the conference, I attended more than 15 talks and presentations with a wide range of context: Radiology and CT, MRI and X-ray, Dosimetry and Radiation Protection, AI in Radiology, Professional advances, and carrier development. Additionally, I interacted and discussed with more than 30 companies and start-ups at their booths in person.

During my stay I obtained new networking opportunities by interacting with representatives from different companies, I gained insights into the latest trends and developments in the industry and make valuable connections that could lead to future collaborations or job opportunities. Secondly, I exposed myself to new technologies and products that as a young medical physicist can use in my research and clinical practice. Furthermore, I received valuable feedback and guidance on my ideas and research projects.

Finally, lectures, workshops, scientific sessions, and interactions with companies helped me to develop important skills in communication, networking, and professional and career development, which are essential for building a successful career in the medical field.

My overall participation at European Conference of Radiology-ECR 2023 clearly improved my knowledge, skills and competitiveness for research and career opportunities in the medical physics, medical imaging and diagnostics, radiation protection and nuclear field.

Ioannis Stathopoulos,

Athens, 08/03/2023
