# Report on Participation in EACR 2025 Congress – Lisbon, Portugal

With support from the European Partnership for Radiation Protection Research, I attended the European Association for Cancer Research (EACR) 2025 Congress held in Lisbon, Portugal. At the congress, I presented a scientific poster titled "**Use of the Cell Division Assay to Evaluate T Cell Toxicity in Response to <sup>177</sup>Lu-DOTATATE Peptide Receptor Radionuclide Therapy.**" This work is part of my PhD project focused on individualized risk prediction of bone marrow toxicity following radionuclide treatment.

Presenting at EACR provided a valuable platform to share my findings with leading researchers in cancer biology, radiation science, and immunotherapy. I received insightful feedback that will help refine my experimental approach and data interpretation. The congress also enabled me to establish new professional connections and stay updated on recent advancements in radionuclide therapies and toxicity assessment.

I am grateful to PIANOFORTE for making this participation possible. Their support played a crucial role in facilitating scientific exchange and strengthening the international visibility of my research.

Sincerely,

Shaghayegh Gharaghani

PhD student in Medical Science at the University of Gothenburg
